I am writing in support of the IANA Stewardship Transition Proposal. This proposal was developed through an open, multistakeholder process that achieved broad support throughout the relevant communities of interest. The strength of the proposal is that it works by continuing and extending existing oversight processes and mechanisms that have been working well for years. While the proposal does introduce new features, specifically the PTI, they have been carefully designed to be firmly rooted in the multistakeholder model of wide community input and participation. This is a conservative, careful proposal that introduces the minimal changes necessary to provide for stable and independent administration of name, number, and protocol parameter resources while avoiding disruption to the Internet community. In summary, the proposal is good for the Internet and should be sent to NTIA for approval.
